Internet Crimes and Cyber Security

Week: 05 **Session: 22**

Topic :Tools and Techniques for Vulnerability Assessment

B Md Irfan
Technical Coordinator (Cyber Security) NALSAR University of Law, Hyderabad

Tools and techniques to Counter Cyber Attacks

3. Countering Cyber Threats technically using Vulnerability Assessment Tools

There are several types of vulnerability assessments. These include:

1.Host assessment – The assessment of critical servers, which may be vulnerable to attacks if not adequately tested or not generated from a tested machine image.
2.Network and wireless assessment – The assessment of policies and practices to prevent unauthorized access to private or public networks and network-accessible resources.
3.Database assessment – The assessment of databases or big data systems for vulnerabilities and misconfigurations, identifying rogue databases or insecure dev/test environments, and classifying sensitive data across an organization's infrastructure.
4.Application scans – The identifying of security vulnerabilities in web applications and their source code by automated scans on the front-end or static/dynamic analysis of source code.

Tools and techniques to Counter Cyber Attacks

1.Web application scanners that test for and simulate known Threat

Tools are :

1. https://urlscan.io/
2. https://www.sitelock.com/free-website-scan/
3. https://www.ssllabs.com/ssltest/
4. https://web-check.xyz/

2. **Protocol scanners** that search for vulnerable protocols, ports and network services.

Tools are :

1. https://dnschecker.org/all-tools.php
2. https://scan.cyberchief.ai/

3. **Network scanners** that help visualize networks and discover warning signals like stray IP addresses, spoofed packets and suspicious packet generation from a single IP address.

Thank You
