Internet Crimes and Cyber Security

Week: 06 **Session: 27**

Topic : **Understanding Threats from Deep Web**

B Md Irfan
Technical Coordinator (Cyber Security)
NALSAR University of Law, Hyderabad

Understanding Threats from Deep and Dark Web

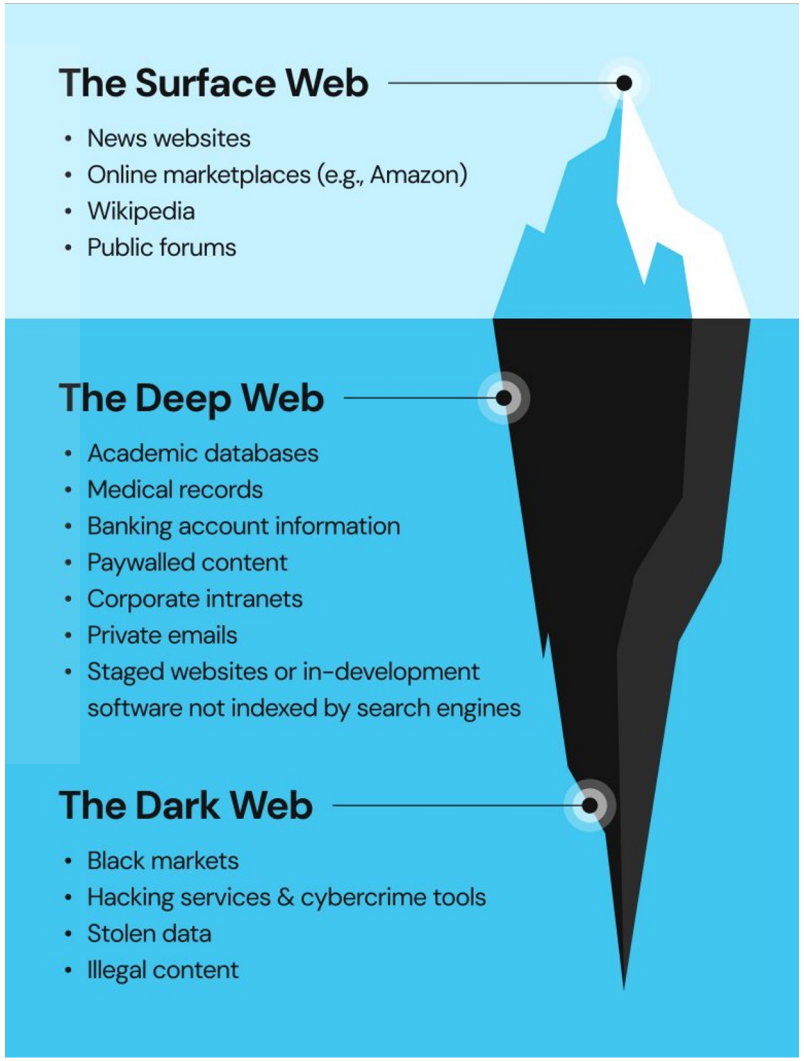
Concepts to be covered

1. What is Deep Web and Dark Web
2. Tools for Accessing Deep web
3. Tools for Accessing Dark web
4. Identify cybercrime threats emerging from Dark Web
5. Understanding investigative challenges in Dark Web
6. Analyze real-world case of Cyber Crimes in Dark Web

Understanding Threats from Deep and Dark Web

1. What is Deep Web and Dark Web

The **Deep Web** is everything online not **indexed by search engines** (your email, bank accounts, private databases), making up most of the internet, while the **Dark Web** is a **small, hidden, encrypted part *within*** the Deep Web, requiring special software like Tor for anonymity, often used for illegal activities but also for privacy. Think of the Deep Web as private content, and the Dark Web as intentionally concealed, anonymous content.

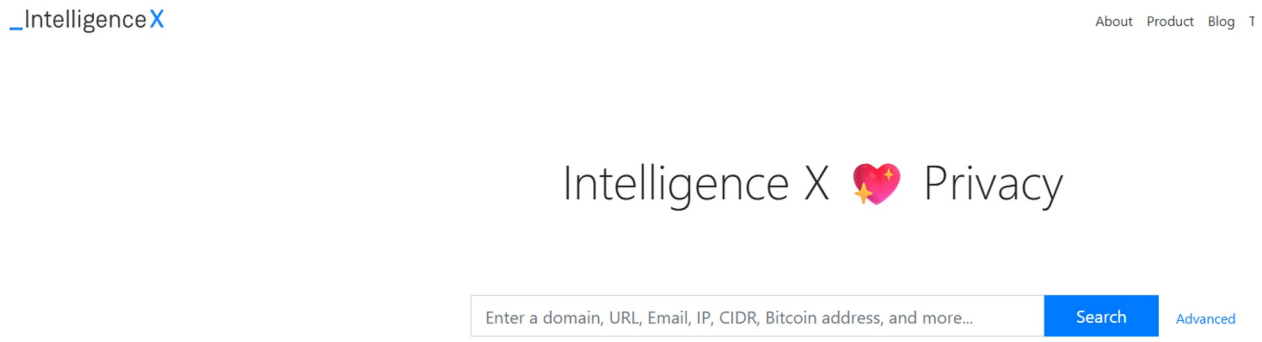


Understanding Threats from Deep and Dark Web

2. Tools for Accessing Deep web

Biznar searches over 100 different search engines at once and removes the duplicates, ensuring you'll find deep web content you wouldn't on Google.

IntelligenceX is a massive search engine that allows you to search document sharing platforms, whois data, data leaks, domains, Bitcoin addresses, and even the dark web.



Understanding Threats from Deep and Dark Web

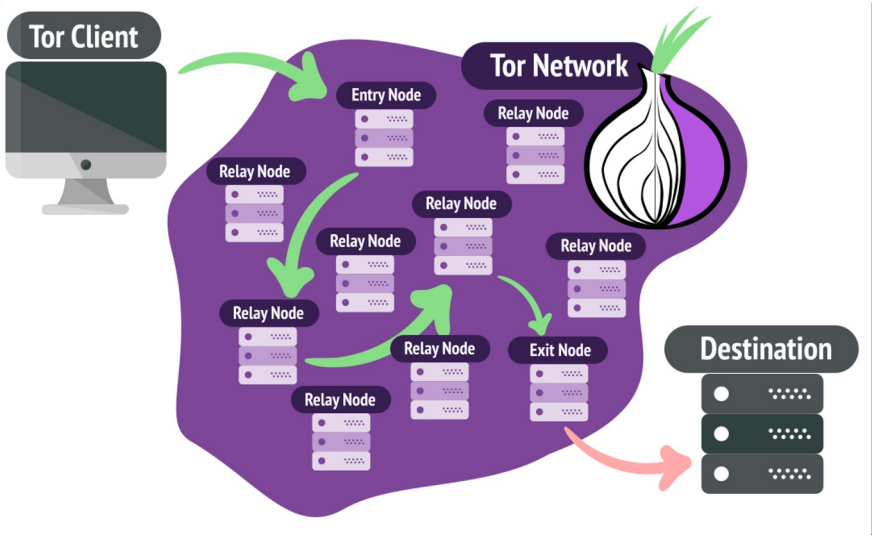
3. Tools for Accessing Dark web

Tor Browser
Tor Browser remains the gold standard for dark web access in 2025. It routes your traffic through multiple encrypted nodes using onion routing technology, effectively masking your IP address and digital footprint.

Brave Browser integrates Tor technology directly into its platform, offering users an accessible, user-friendly gateway to the dark web.

Freenet
Freenet operates uniquely, functioning as a decentralized, peer-to-peer network rather than a traditional browser. It encrypts and distributes data across a vast, anonymous network of user nodes, ensuring extreme levels of anonymity and censorship resistance.

I2P Browser
The Invisible Internet Project (I2P) Browser emphasizes a fully encrypted, decentralized approach to dark web access, routing traffic through an anonymous network of user-operated tunnels. It supports both web browsing and secure communication, offering additional services like email and instant messaging fully integrated into its secure environment.



Thank You
